

Embed a video on a page using embed code

If you want to use embed code from a third-party video-sharing website to add a video to a page, you can do so by adding the embed code to the Content Editor Web Part.

You must have Designer permissions to follow this procedure.

1. Locate the video that you want to embed on the page, and copy the embed code.
2. Go to the page you want to update.
3. On the **Page** tab of the ribbon, click **Edit**. Do one of the following:
 - If you are editing a wiki page, click a location on the page where you want to add the Content Editor Web Part, click the **Insert** tab of the **Editing Tools** ribbon, and then click **Web Part**. Under **Categories**, click **Media and Content**. Under **Web Parts**, click **Content Editor**, and then click **Add**.
 - If you are editing a Web Part page, click **Add a Web Part** in the column or zone you where you want to embed media. Under **Categories**, click **Media and Content**. Under **Web Parts**, click **Content Editor**, and then click **Add**.
4. In the Content Editor Web Part, point to the arrow, and click **Edit Web Part**.
5. In the Content Editor Web Part, type any text you want to display to introduce the video.
6. On the **Format Text** tab of the **Editing Tools** ribbon, in the **Markup** group, click **HTML**, and then click **Edit HTML Source**.

7. Paste the embed code into the **HTML Source** dialog box, and then click **OK**.
8. Save the page (or save and check in, if checkout is required for pages on the site).
9. Click the play button on the embedded video player to play the video.
